

ALL BLUE

ALL BLUE

Premium Blend of Kentucky Bluegrasses

All Blue Kentucky Bluegrass blend establishes 40% faster than common Kentucky Bluegrass formulas. All Blue is genetically diverse and widely adapted. Kentucky Bluegrass is the cool season grass of choice. It is more durable than fescues, grows denser, darker green in color, very winter hardy, and has the preferred lawn look. All Blue is unique compared to straight Kentucky Bluegrass varieties because it is a blend of improved bluegrass varieties that are darker in turf color and germinate faster. All Blue will adapt to a wide range of growing and maintenance conditions because it contains three varieties of bluegrass with unique performance characteristics. All Blue is the best choice when selecting straight bluegrass because it will green-up earlier in the spring, grow denser and darker, creating a fast establishing, high quality lawn that will compete aggressively with weeds.

Seed Mix

- 40% Arc Kentucky Bluegrass
- 40 % Dragon Kentucky Bluegrass
- 20% Guinness Kentucky Bluegrass

Characteristics

Very fast establishment	Persistence	Early spring green-up	Good drought tolerance
Winter-hardy	Medium texture	Dark green color	High seedling vigor
Low growth profile	Good durability	High wear tolerance	Good fall color retention

Establishment Tips

Kentucky Bluegrass is a resilient perennial turf grass, it's biggest deficiency is speed of establishment. Common varieties of Kentucky Bluegrass will take two to three times longer than ryegrass to germinate. All Blue is unique in that it will germinate about 4 days after ryegrass when the ground temperature reaches the mid 60's. To thicken an existing lawn use All Blue dormant seeding in the late fall, or frost seeding in the very early spring (when the ground is just beginning to thaw). Slit seed or aerate is the most efficient when seeded early in the spring before the mature lawn is actively growing. When over-seeding, mow lawn as short as possible and wait until seed has germinated to fertilize the area.

Maintenance Tips

Kentucky Bluegrass lawns that are recovering from drought stress should be fertilized with our GreenGuard Lawn Maintenance Mix in mid-August and with Winterizer in late September. Lawns that have been damaged by cold, open winters will recover more quickly when fertilized with our GreenGuard Lawn Maintenance Mix about the first of May and again in early June. Apply Pro-Quench in early June to sustain lawn health through summer stress periods. All Blue will perform best if mowed no lower than 3 inches in height and never remove more than 30% of the height in one mowing, especially in the summer. This height produces a healthier defense to summer stress, disease, insects, and the development of weeds. The most successful fall program is to reduce mowing height to 2 inches mid-October, to better prevent spring disease infestation.

Seeding Rates

Before planting use our GreenGuard Soil Prep Plus to promote root development and faster establishment.

New Lawns: 150-175 lbs. per acre **Repairing:** 2-3 lbs. per 1,000 square feet based on severity of damage.
