

A YEAR ROUND DEER ATTRACTANT

High performance grass and legumes for palatability and nutritional benefit. Deer Magnet will increase the frequency of feeding, improve antler development, increase doe lactation, and produce better developed offspring.

Formula

30% Sweet Tart Festulolium
30% Medium Red Clover
20% Alfalfa
10% White Ladino Clover
10% Alsike Clover

Sweet Tart Festulolium

By combining characteristics of both ryegrass and meadow fescue, Sweet Tart Festulolium gives you the best of both worlds. Sweet Tart looks like ryegrass, it tastes like ryegrass, and it digests like ryegrass. But it doesn't stop there. It is heartier than a ryegrass, and the meadow fescue component allows better heat tolerance in the summer and better cold tolerance in the winter. Sweet Tart Festulolium will be the first grass eaten in the food plot and will provide improved digestion, protein, and minerals. Sweet Tart's persistence and outstanding yields result in a forage grass that truly is the best of both worlds.

Medium Red Clover

Medium Red Clover provides an excellent source of energy, protein, and calcium required for weight gain and antler development.

Alfalfa

Alfalfa is often referred to as the "Queen of Forages," because it produces high yields that are highly digestible and high in protein. Alfalfa is important to deer for its calcium, protein, and vitamins to improve weight gain and antler development.

White Ladino Clover

White Ladino Clover is the most palatable forage clover because when it goes to flower the deer will continue to eat it while rejecting other legumes. White Ladino Clover is an excellent source of calcium, protein, and energy required by white-tail deer.

Alsike Clover

Alsike Clover is an easy to establish clover for poor quality soils. However, alsike clover is intolerant of drought and high temperatures. It provides a good source of energy, protein, and calcium required by deer.

Planting & Seeding

This mixture is best planted in the spring when moisture is adequate. Recommended seeding rate is 20-25lbs per acre in a well-prepared seed bed. This will reduce competition and extend length of performance.

Fertilization

Recommendation: Apply 300lbs high calcium lime and 200lbs GreenGuard 7-8-7 Vegetable & Flower before seeding and annually every fall. This will extend the life of the stand, attract more animals, and improve forage quality.

Maintenance: To attract deer all season long, mow three times during the summer. For improved fall performance cut plot sometime in early August and fertilize.
