

# DEER & TURKEY

## A Full Season Source of Food

Clovers are the most palatable food source you can offer deer or turkeys. It provides an early food source in the spring and stay vegetative well into late fall with very little maintenance. Clovers are an excellent high protein food source that provides energy, a wide range of minerals, and is easily digestible. Deer prefer plants that are vegetative and easily digestible. Turkeys like the leaves of the Ladino Clover and with the seed heads it produces they will feed in those fields regularly.

## Formula

50% White Ladino Clover  
40% White Dutch Clover  
10% Small Burnet Clover

## White Ladino Clover

White Ladino Clover is the most palatable forage clover because when it goes to flower the deer will continue to eat it while rejecting other legumes. White Ladino Clover is an excellent source of calcium, protein, and energy required by white-tail deer.

## White Dutch Clover

White Dutch Clover is tolerant of heavy grazing, trampling, and cutting. White Dutch clover provides a high protein food source and a good habitat for wildlife.

## Small Burnet Clover

Small Burnet Clover is a highly attractive and adaptable clover. It is suitable for a wide range of growing conditions, however it does not do well in extremely moist areas, poorly drained soils, or areas prone to flooding. Small Burnet Clover has coarse stems, green leaves, red flowers, and grows best in full sun.

## Planting & Seeding

This mixture is best planted in the spring when moisture is adequate. Recommended seeding rate is 20-25lbs per acre in a well prepared seed bed. This will reduce competition and extend length of performance.

## Fertilization

Recommendation: apply 300lbs high calcium lime and 200lbs 7-8-7 GreenGuard Vegetable & Flower per acre before seeding. This will attract more deer, improve forage quality, and increase nutrient value.
